

artacent[®]

WOUND

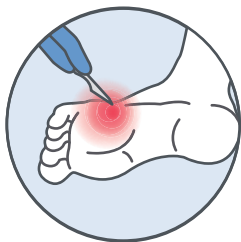

APPLICATION GUIDE

1. Ensure the wound is free of active infection and then **prep the wound site**. *Do not use Betadine.

4. Open the sterile sealed pouch and place **Artacent Wound[®]** using either side of the allograft directly on the granular bed of the wound.

2. **Debride wound**, removing all the necrotic (dead) tissue.

5. Apply **non-adherent bandage** to cover Artacent Wound. Then **wrap** the area with gauze. *Optimal dressings promote moisture balance and provide exudate control.

3. Open the outer peel pouch and deliver the innermost sterile sealed pouch containing the allograft material to a **sterile field**.

6. **Assess wound** and repeat dressing and off-loading weekly as necessary.
